SUMMARY

Aspiring Security Researcher and Bug Bounty Hunter with a growing focus on web application security. Interested in identifying complex vulnerabilities beyond automated scanning, particularly Business Logic flaws, Server-Side issues, and Broken Access Control. Developing a deeper understanding of backend application behavior and how vulnerabilities emerge from flawed logic and design. Currently studying advanced web exploitation concepts, while strengthening practical skills through hands-on labs and experimentation. Driven to build a strong offensive security mindset and continuously improve through real-world practice.

EDUCATION

Bachelor's Degree in Business Information Systems (BIS)

Misr Higher Institute for Commerce & Computers

Graduated: July 2026

PROJECTS

Nabd - Blood Bank & Donation Management System (Graduation Project) *A comprehensive, multi-branch system designed to automate the blood donation lifecycle and predict demand using AI.*

- **System Architecture & Logic Design:** Architected the core logic, database schemas (PostgreSQL), and data flow for the entire application, successfully leveraging AI coding assistants for rapid backend generation and integration via Django.
- **Security & Access Management:** Designed and implemented strict Role-Based Access Control (RBAC) to isolate privileges among hospital branches, lab technicians, and system admins, ensuring data privacy.
- **White-box Testing & Vulnerability Analysis:** Built the system from the ground up to gain a deep, practical understanding of backend architecture (MVC/MVT) and developer blind spots, directly enhancing my web application penetration testing capabilities.

SKILLS

Web Application Security:

- OWASP Top 10
- Business Logic Vulnerabilities
- Broken Access Control (RBAC)
- API Security

Tools:

- Burp Suite
- FFUF
- Nuclei
- Wireshark
- Nmap
- Git

Programming & Scripting:

- Python
- JS
- PHP
- Bash
- SQL

Operating Systems:

- Linux
- Windows

LANGUAGES

- Arabic (Native)
- English (Intermediate)
